Job Reflection Paper First

100 Hours

I now have a much better idea of what it's really like to work in IT support after completing 100 hours as a remote support specialist. Although I was previously interested in IT and cybersecurity before to this job, working directly with people and resolving actual issues has been extremely different from what I had anticipated. I spent the first fifty hours mostly getting to know the team, learning about the surroundings, and familiarizing myself with the tools we use. I began to feel more at ease managing tickets and comprehending the inner workings of the systems we serve throughout the second fifty hours.

The differences between actual technological issues and those we encounter in the classroom caught my attention. Problems in schools often have a clear solution and are organized. In actual IT assistance, a user's reported issue is often only one aspect of the problem. When you begin troubleshooting, you may discover that there might be a number of various

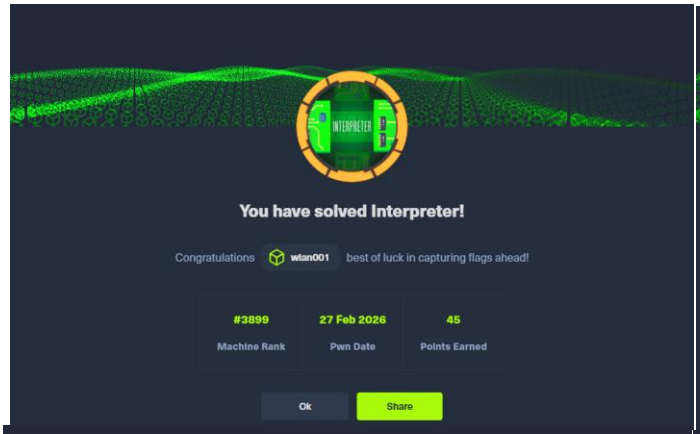
reasons why a program isn't functioning, such as permission problems, outdated software, or system limitations the user was unaware of etc.

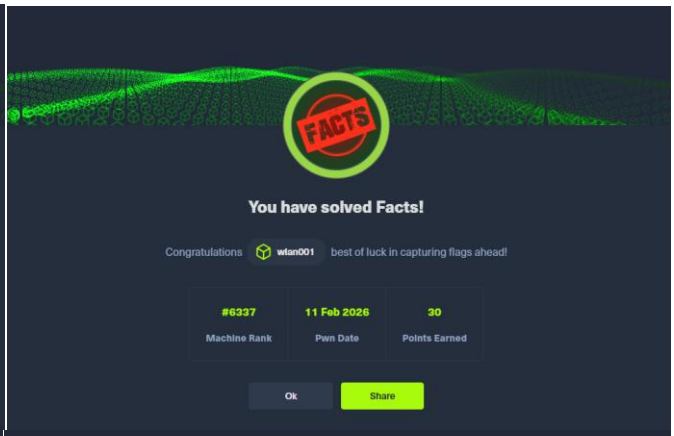
When I attempted to assist a customer with a software problem but was unable to remotely connect to their machine, it was an experience that taught me a lot. In order to view precisely what is going on and troubleshoot immediately, I often depend on remote solutions like LogMeIn Resolve. I had to depend entirely on the user to describe what they were seeing and follow my directions since the connection was dropping. This first irritated me since I'm used to either being remotely connected to the computer or, in previous positions, physically sitting at the machine and resolving the problem. Instead than simply performing the task alone, it made me concentrate considerably more on communicating and clearly outlining processes. In retrospect, it proved to be a worthwhile educational experience as it enhanced my ability to convey technical instructions to users.

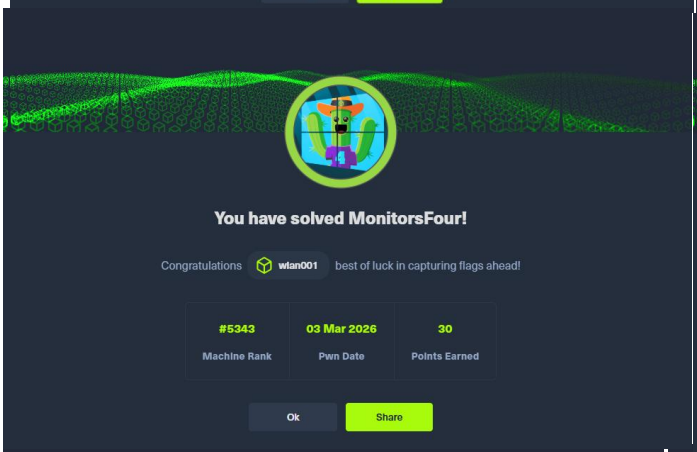
I've also come to understand how crucial cooperation and documentation are to IT support throughout this 100 hours. It helps other technicians understand what has previously been tried and avoids repeating the same problem processes when clear ticket updates and internal notes are written. I also discovered that working together with coworkers is common and crucial. I feel more at ease asking inquiries when I need advice since even seasoned experts seek one another for assistance when they encounter new problems.

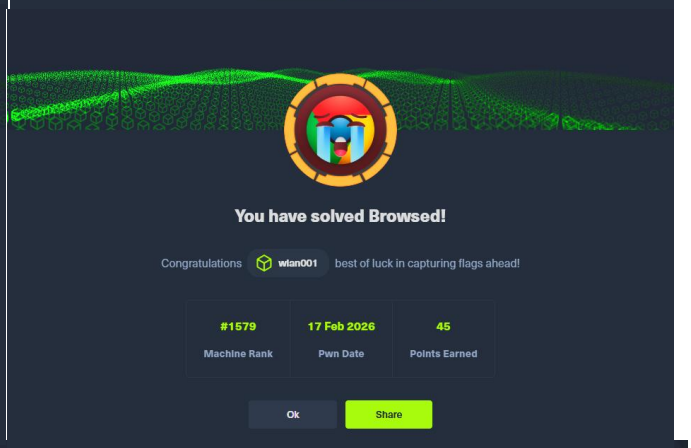
My confidence has changed the most between the first and second fifty hours. I was anxious about managing tickets and communicating with users when I first began since I didn't

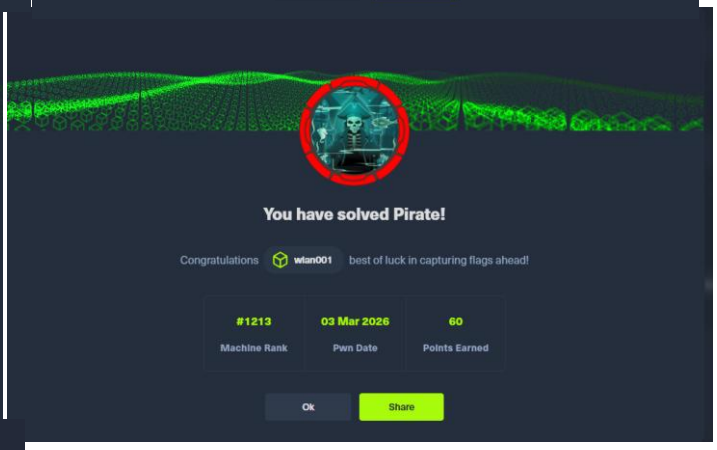
want to make errors. I feel more at ease confronting issues and considering potential answers now. Since many consumers are already irritated when they seek for assistance, I've also discovered that patience is a crucial component of IT job. Just as crucial as the technical answer is maintaining composure and helping them solve the issue step-by-step.

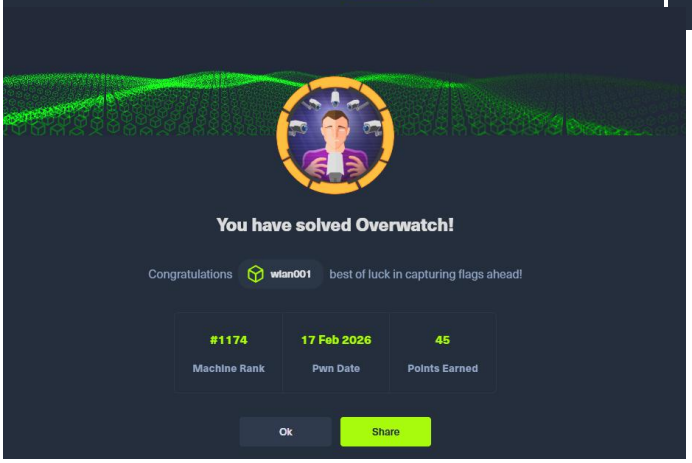
All things considered, these first 100 hours have been worthwhile. My communication skills, troubleshooting ability, and comprehension of how IT support functions in a professional setting have all increased. I've learned from the experience that real-world technological issues often call for patience, research, and effective communication rather than instant fixes.












Extra: On my off time I've been practicing my pen testing skills so here are some boxes I've recently pwned on hackthebox.
